

Operation: updateProductStock(id: int, w: int, s: int)

Cross References: Use Case: Create Automatic Order on Shortage (f)

Preconditions:

- A product with the given id exists in the system
- w and s are non-negative integers

Postconditions:

- product.storage_amount became w (attribute modification)
- product.shelf_amount became s (attribute modification)
- product was saved to the database (attribute modification)
- If product.totalStock <= product.minStock, a LowStockAlert instance was created (instance creation)
- If product.totalStock <= product.minStock, LowStockAlert was associated with the product (association formed)
- If product.totalStock <= product.minStock, an automatic order was created and associated with the cheapest supplier (instance creation, association formed)
